

Supplementary Figure 1: Plot of surgery time in relation to prostate size for conventional holmium laser enucleation of the prostate (HoLEP) and 3 horse shoe-like incision HoLEP Pearson's correlation coefficient (R) is shown for both procedures. Median is given in green.

Supplementary Figure 2: Plot of surgery time per mL of prostate volume for the different procedures. Blue depicts regular holmium laser enucleation of the prostate (HoLEP), while red dots depict 3 horse shoe-like incision (HSI) HoLEP procedures. The mean is shown in light green. 3 HSI HoLEP was associated with a significant lower surgery time per mL ($p=0.0001$).
